Streamline efficiency and automate productivity with the
Server Station innovation

Server Station

The innovative features of Intec's ColorCut Server Station will streamline the entire cutting process, increase workforce productivity, reduce costs - and increase profits.

Key features:

- The *Server Station* is supplied complete with a pre-installed Windows® PC and ColorCut Pro software suite, with a flat screen monitor, mouse and keyboard

- ColorCut Pro *Job Library Manager* is a network library for cut files, pre-installed on the Server Station and provides one central and synchronised source for all ColorCut users.

- ColorCut Pro *Production Studio 4* is the core operating software pre-installed on the Server Station

- The Server Station includes an additional software *User Licence* enabling two extra user seats

- **New features available soon can be freely downloaded in future updates**

Hello central hub

Whilst the ColorCut Pro software supplied with each cutter can be used to simply cut files directly from the user's desktop - high-productivity environments will certainly reap the rewards provided via the automation which the Server Station offers!
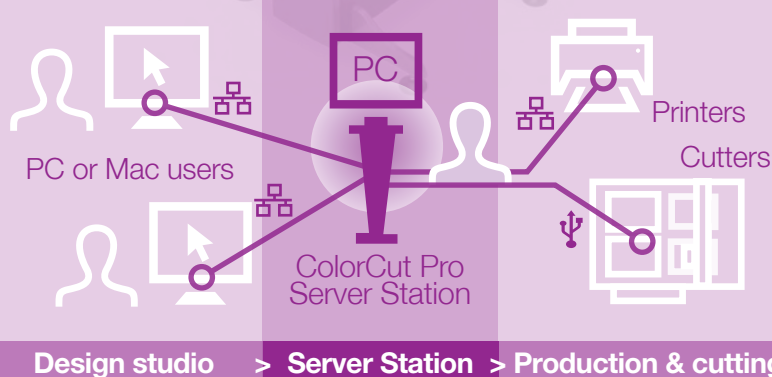

Intec ColorCut Server Stations are the central hub of ColorCut's cutting ecosystem - connecting to each networked graphic designers' system and integrating with the print/finishing room for seamless workflow automation.

Along with its innovative features, the Server Station provides a 'level playing field' for all associated devices – removing the headaches often suffered by varying operating systems and conflicting program versions on one network. And reduced need to rely upon dealer support.

By off-loading final jobs from designers' computers and into the production workflow, the Server Station enables the design studio to continue with their creative tasks, whilst enabling print production staff to pick up the process of job cutting, without further impact upon the design studio's time or physical movements.

This also means design studios and print finishing zones can continue to be independently located, if desired. This level of contactless automation also helps progressive organisations achieve streamlined non-touch processes demanded by many QC accreditations.

It's ColorCut Pro - and so much more!

Versions of ColorCut Pro residing upon the Server Station are commissioned to operate at a much more advanced level than 'stand alone versions. All Server Station users will benefit from a whole host of premium-grade features which make a quantum leap in functionality and productivity.

Job Library Manager: Acting very much like a RIP workflow, this sophisticated feature brings massive functionality to the networked library of cut job files. One central and synchronised source for all ColorCut users.

SmartColors: Random colours specified in supplied artwork for cutting, creasing, perforation tasks, get migrated to SmartColors to suit the ColorCut environment - and also get saved for each time that job is recalled.

Virtually zero errors: The simplicity of having one central hub for all users and the way in which users become trained to adopt a common working practice - means the Server Station makes production errors a problem of the past.

2 additional user seats: Additional users are included in the licence for Server Station customers.

PC and Mac compatible: Cut files can be received from both PC and Mac directly into the Sever Station Job Library Manager.

Contact your Intec sales team for full details and a virtual demonstration of how the Server Station can enhance your business.
